BOLLARDS

a PERFORMANCE DRIVEN company

Bollards

Bollards are the perfect choice for securing critical facilities without sacrificing aesthetic appeal. Designed to fit a variety of applications, bollards are available in passive, as well as manual, electromechanical, pneumatic, and hydraulic models. Standard in-ground models offer a high level of protection in areas where adjacent space may be limited, while shallow mount systems utilize a wider foundation for locations where site conditions may prevent deep excavations. Decorative covers can also be added for a more pleasing appearance. Tusco regularly installs crash rated bollards at locations such as data centers, government buildings, sports venues, military bases, and airports.

Tusco's team of certified installers are qualified and experienced in the installation, operation, and maintenance of all types of bollards.
